## Sage-Grouse Initiative Threat Checklist NRCS-Idaho

Participant:		
Planner:		
Date:		

Instructions: Choose "Yes" or "No" for all potential threats. Those marked "Yes" are considered identified threats present on the proposed enrolled acreage. Circle the treatment option the landowner will implement to address each threat. Calculate the percentage of identified threats the landowner will address for use in the SGI AERT.

Note: All practices will be planned under Upland Wildlife Habitat Management (645) as the umbrella practice. Use the Species Habitat Evaluation for Greater Sage-Grouse in Idaho and the Threats Checklist below to identify habitat conditions and limitations in the planning area. Complete the applicable 645 specification sheet, referring to facilitating practices listed under Treatments below, and attaching additional specification sheets for those practices as needed.

Potential Threats	YES	NO	Treatments
1. Wildfire and cheatgrass invasion threaten existing sagebrush-grassland habitat.			Develop strategically placed firebreaks and consider using greenstripping techniques. NRCS Practices - Firebreak (394) and Range Planting (550).
2. Current grazing management does not allow for sustainable range conditions to persist			Implement grazing strategy that allows for sustainable range condition and increased residual cover for nesting. NRCS Practices - Prescribed Grazing (528), Fence (382), Watering Facility (614) and associated practices.
3. Current grazing management does not allow for adequate residual cover in sage-grouse nesting habitat to maximize nest success.			Implement grazing strategy that allows for increased residual cover for nesting. This will be accomplished with a rest-rotation grazing system on 20% of available nesting habitat to allow complete growing season rest in year 1 continuing through the end of the nesting season in year 2 (i.e. April 1 <sup>st</sup> in Year 1 through June 15 <sup>th</sup> in Year 2. NRCS Practices - Prescribed Grazing (528), Fence (382), Watering Facility (614) and associated practices.
4. Fences or other structures are within 0.6 mile of a lek or are documented as contributing to sagegrouse mortality or increased predation.			Remove, relocate or mark problem fences and structures. NRCS Practices - Fence (382), Obstruction Removal (500).  Note: 382 will be used to design fence marker and perch deterrent projects and to replace removed fences in more appropriate locations. 500 will be used to remove problem fences and structures.
